NEWS: We got a shorter URL! Reach us via lmarena.ai

Rules

- Ask any question to two chosen models (e.g., ChatGPT, Gemini, Claude, Llama) and vote for the better one!
- You can chat for multiple turns until you identify a winner.

Choose two models to compare

Model A

Add support for batch conversion of measurements from files and include summary statistics for the converted data.

Certainly! I'll modify the unit converter to include support for batch conversion from files and add summary statistics for the converted data. Here's an updated version of the script with these new features:

```
import tkinter as tk
from tkinter import ttk, filedialog
import requests
import json
import csv
import statistics
```

```
class UnitConverter:
    def __init__(self, master):
        self.master = master
```

Model B

Add support for batch conversion of measurements from files and include summary statistics for the converted data.

Sure! Let's extend the script to support batch conversion of measurements from files and include summary statistics for the converted data. We'll assume the input file contains one measurement per line.

Here's the updated script:

```
import tkinter as tk
from tkinter import ttk
from tkinter import filedialog
import requests
import statistics
```

👉 A is better

👉 B is better

🤝 Tie

👎 Both are bad
