Model A

Model B

Create unit tests to ensure the accuracy of conversions between various measurement units.

Certainly! Here's a set of unit tests to ensure the accuracy of conversions between various measurement units. We'll use the `unittest` module in Python to create these tests. Let's assume we have a `Converter` class that handles the conversions.

```
import unittest
from decimal import Decimal
from converter import Converter

class TestUnitConverter(unittest.TestCase):
    def setUp(self):
        self.converter = Converter()

    def test_length_conversions(
```

Create unit tests to ensure the accuracy of conversions between various measurement units.

Certainly! Let's create unit tests to ensure the accuracy of conversions between various measurement units. We'll use the `unittest` module in Python to write and run the tests.

Here's an example of how you can create unit tests for the conversion functions:

```
import unittest
from decimal import Decimal

class ConversionTests(unittest.TestCase):
    def test_currency_conversion(
        # Test currency conversion
        value = Decimal('100')
```

👉 A is better

👉 B is better
